

## American architect and architecture Volume 86

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1904 Excerpt: ...is satisfactory. The New York Subway is now ventilated in the up-town sections, and if the moving trains in the down-town portions do not force out sufficient air at the station exits, artificial ventilation can at any time be introduced. PASSENGER ELEVATORS.--I. IT is not the writers intention to describe the multitude of details used in passenger elevator practice, but to outline the steps of their general evolution, and the results attained, or sought to be attained, in the effort to improve their efficiency, service and safety. Until the advent of the first steam passenger elevator, nearly half a century ago, buildings were limited to a few stories, and, while this type of elevator stimulated increased height, its operation was too slow to create a very marked effect, and it was not until the hydraulic elevator was introduced that much increase in the height of buildings was noticeable. The water-balance elevator was introduced at an early date, and was installed in a few buildings throughout the country; one in the Western Union Building, New York City, survived until destroyed by fire about twelve years ago. This elevator consisted of a car suspended by cables passing over a sheave at the top of the building and attached to an iron bucket weighing less than the car. At the will of the operator, the bucket could be filled with water or emptied by a hand cable, attached to a water-supply valve at the top of the building and to an exhaust valve in the bottom of the bucket. The bucket worked in an iron stand-pipe. When sufficient water was admitted to the bucket to overbalance the car and its load, the bucket descended and the car ascended, and when the water was allowed to discharge from

the bucket the car descended. The machine was controlled by ...
